

Mumbai Real Estate: Entry, Intelligence & Execution System

How to enter the Mumbai/MMR residential market as a compliant, revenue-first micro-market advisory and brokerage desk — with the evidence re-verified to August 2026, the analytical model corrected, the work broken down to assignable packages, and the capital requirement stated plainly.

HOW TO READ A NUMBER

Every fact carries a source tag — [SRC-004] — resolving to the registry in appendix G1. Every figure states its confidence in the footnote. Analyst constructs are labelled **MODEL** and must never be quoted as market data.

CONFIDENCE GRADES

HIGH primary, statutory or published consultancy figure. **MEDIUM** reputable secondary reporting. **LOW** portal or asking aggregate — directional only. **MODEL** analyst judgement.

NEW IN VERSION 2

Fourteen substantive corrections, all H1 and July 2026 data re-verified, the Certificate of Competency and DPDP obligations added, the entry model rebuilt with sensitivity testing, and full workload, funnel and capital models.

WHAT THIS IS NOT

Not legal, tax or investment advice. Confirm every regulatory position with a qualified professional, and re-verify every market number against its source — all of them move.

Executive summary

The recommendation is unchanged in shape from version 1 and materially different in substance: build a micro-market advisory and brokerage desk in one corridor, and build the compliance, demand and deal machinery alongside the data system rather than after it. What follows is why, and what it costs.

Eastern & Central

recommended first corridor

score 8.00 of 10 · wins 99% of randomised weightings

6 weeks

compliance critical path

Certificate of Competency now mandatory

₹8.1 L

conservative cash trough

₹11.3 L is the capital to actually raise

₹32.6 L

base-case Year-1 income

on 15 closures and 2,860 founder-hours

The market is large enough, and it is not the constraint

Mumbai cleared **47,355 residential sales** and **80,221 registrations** in the first half of 2026 — the strongest half since 2013 — against **₹6,968 crore** of stamp duty [SRC-004, SRC-005]. July continued it: 13,617 registrations and ₹1,223 crore, the highest July in fourteen years [SRC-006]. Roughly thirteen to fourteen thousand addressable, dated, public transactions clear every single month.

Against that, unsold inventory stands at **157,410 units**, the largest pool in India, and it rose 4% year on year across the top eight markets [SRC-032]. Quarters-to-sell is 6.5 [SRC-004]. This is a market with deep flow and real overhang, which is precisely the condition under which *selection and negotiability* — not price forecasting — is the sellable skill.

The constraint is the founder's calendar and the compliance clock

The single most important change since version 1 is regulatory. From January 2026 a MahaRERA agent cannot register or renew without a **Certificate of Competency**, obtained through a twenty-hour programme and an examination via an empanelled partner [SRC-002]. That is a six-week critical path that no amount of effort compresses, and no lawful revenue exists before it closes. Advertising rules now mandate a QR code and registration number on every advertisement, at ₹10,000–50,000 per violation [SRC-017] — and a WhatsApp pocket brief is an advertisement. Registered agents also file a half-yearly compliance report [SRC-018], and the DPDP Rules, notified in November 2025, apply to a one-person business with no exemption [SRC-023].

Where to start, and why the model and the narrative now agree

The corrected entry model ranks the **Eastern and Central Suburbs** first at 8.00, ahead of Thane–Ghodbunder at 7.68, with Navi Mumbai and the Western Suburbs genuinely tied at 7.48. Eastern/Central wins not by leading any single criterion but by having no weak one: it is the only corridor combining real transaction depth with the highest execution simplicity in the region. Under 5,000 randomised weight vectors it stays first 99% of the time.

In version 1 the narrative recommended Eastern/Central while the model ranked Navi Mumbai first, and the contradiction was noted but never resolved. It is resolved here.

What it earns, honestly

At the modelled mix — average consideration ₹2.30 cr at a blended 1.32% commission — fifteen closures produce ₹45.7 L of gross commission and about ₹32.6 L post-tax against 2,860 founder-hours. That is roughly **₹1,140 an hour**. In the conservative case it is about a third of that. This is the honest comparator to a salaried alternative, and it is the number version 1 never produced.

THE ONE-SENTENCE THESIS

Know twenty-five pockets better than anyone selling in them, transact inside those pockets, capture every observation and closure as structured evidence, and expand only when the economics repeat without you in every step.

The verdict — what this business is, and what it is not

Version 1's central instinct was right and its sequencing was wrong. The correction is not a change of strategy; it is a change of order.

WHAT THIS BUSINESS IS

A brokerage that happens to have unusually good data. Revenue comes from transactions from month four onward. The intelligence layer exists to win trust, shorten shortlists and strengthen negotiation — all of which are inputs to closing, not substitutes for it.

A twenty-five-pocket business, not a Mumbai business. The advantage is depth in a small geography that a scale competitor cannot economically match, and a local broker cannot document.

WHAT IT IS NOT

Not a property portal. The top five platforms hold roughly half of proptech revenue [SRC-026]. Competing on listing breadth against a funded platform, from a standing start, with one person, is not a strategy.

Not a data product, yet. Paid research has no buyer until the dataset contains proprietary observations that have survived live transactions. That is a Year-2 conversation at the earliest.

Not a passive-income business. It is a service business with a research habit, and the founder is the service for at least twelve months.

The five decisions this document makes

Corridor	Eastern & Central Suburbs — Powai, Kanjurmarg, Vikhroli, Bhandup, Mulund, Ghatkopar. Six localities, 20–30 pockets, frozen for ninety days.
Sequence	Compliance, data and demand built in parallel from week 1. Marketing gated at week 6 on the Certificate of Competency. First closure targeted month 5.
Revenue	Resale brokerage and rentals first; developer channel-partner work second; paid data products not before Year 2.
Capital	₹11.3 L raised before starting — the conservative cash trough plus 40%. Founder drawings are the largest single line in the burn and the main lever on it.
Expansion	Thane second, then Navi Mumbai. Only at month 8, and only if corridor-1 closures happen without the founder present at every step.

The three ways this fails

- **The database becomes the business.** Research is infinitely expandable and feels like progress. If deal-execution hours are still zero at month five, the plan has already failed — this is why the hour budget on page 27 is a budget, not a description.
- **Marketing starts before certification.** The temptation at week 3, with a good pocket brief written and nobody to send it to, is enormous. It is also the one mistake that can end the venture rather than delay it.
- **Runway is shorter than the sales cycle.** Mumbai residential deals routinely take 60–120 days from first enquiry to registration. Capital sized to the base case rather than the conservative case turns a normal slow quarter into a forced exit.

Corrections ledger — what changed from version 1, and why

Fourteen substantive corrections. Three are regulatory changes that post-date the original research; the rest are analytical errors, internal contradictions between the PDF, the workbook and the CSVs, or material omissions. Each is stated with the failure it would have caused.

Certificate of Competency [SRC-002]	WAS Certification described as a capacity-building programme agents 'should' complete.	NOW Mandatory from January 2026. Registration and renewal are gated on it. It is a 20-hour programme plus exam through NAREDCO, REMI or RAGC and takes real calendar time.	WHY IT MATTERS This is now the critical path for the entire venture. Week-1 booking is non-negotiable; no compliant revenue exists before it is issued.
Advertising compliance [SRC-017]	WAS Not addressed.	NOW QR code, MahaRERA number and website must appear top-right on every advertisement, at a font size at least as large as the largest contact detail. Rs 10,000–50,000 per violation.	WHY IT MATTERS Every WhatsApp brief, listing and social post in the lead engine is an advertisement. The lead engine cannot launch before the artwork template exists.
Half-yearly reporting [SRC-018]	WAS Not addressed.	NOW Registered agents must file a half-yearly report of facilitated projects. Delay attracts penalty and possible suspension.	WHY IT MATTERS A recurring compliance obligation that must be designed into the record-keeping schema from week 1, not retrofitted at month 6.
DPDP Act [SRC-023]	WAS Mentioned only as 'KYC/privacy/consent workflow'.	NOW DPDP Rules were notified 13 Nov 2025 with phase-in to approximately mid-May 2027. There is no small-business exemption. Notice, consent, purpose limitation, retention and breach notification all apply to a one-person brokerage.	WHY IT MATTERS Lead and KYC data is the core operating asset. Building the consent layer later means re-collecting consent across the entire client base.
Unsold inventory direction [SRC-032]	WAS Workbook note read 'reported down 4% in cited coverage'.	NOW Top-8 unsold inventory rose 4% YoY to 525,695 units. Mumbai holds the largest pool at 157,410.	WHY IT MATTERS The direction was inverted. Rising inventory strengthens the selection-and-negotiability thesis rather than weakening it — but it must be stated correctly.
Absorption metrics missing [SRC-004]	WAS Sales, launches and inventory given as absolute counts only.	NOW Mumbai QTS is 6.5 quarters and age of unsold inventory is 13.5 quarters, improved from 14.3.	WHY IT MATTERS Absolute counts do not tell you whether a market is sellable. QTS and inventory age are the metrics that price negotiability, and they are the ones a client will ask about.
Infrastructure status [SRC-007] [SRC-008] [SRC-009] [SRC-010] [SRC-029]	WAS Metro Line 6 at 79.63% and NMIA 'operational live flight status' were the only two infrastructure facts carried.	NOW Metro Line 3 is fully commissioned (Oct 2025). NMIA runs 24×7 with international services. Metro 2B, 4/4A and 6 are all in 2026 commissioning windows. Coastal Road Phase 2, the Thane–Borivali tunnel, Metro 8 and the Virar–Alibaug corridor sit further out.	WHY IT MATTERS Scoring a corridor on an announced asset and an operational asset identically is the most common analytical error in Indian real-estate research. The status ladder now carries a weight multiplier so operational assets dominate.

Corrections ledger · continued

Ready Reckoner rates [SRC-014]	WAS Listed as an annual refresh with no current reading.	NOW Maharashtra froze RR rates for FY2026-27. The last revision was 1 April 2025 (Mumbai +3.39%).	WHY IT MATTERS RR is the floor under stamp duty and a live negotiation input. A frozen year is itself a material fact for any client comparing the cost of transacting now versus later.
Transaction cost stack [SRC-013] [SRC-024]	WAS Referred to generally as 'transaction costs'.	NOW Mumbai: 6% stamp duty for male buyers, 5% for female sole owners (both include 1% metro cess), plus 1% registration capped at Rs 30,000, plus 1% TDS under 194-IA above Rs 50 lakh. The 15-year resale lock-in on the women's concession was removed in 2026.	WHY IT MATTERS This is 7–8% of consideration. It belongs in every affordability calculation and is one of the highest-value things an advisor can get right on day one.
Priority model weights and scores [SRC-025]	WAS Weights summed correctly but the workbook and CSV disagreed with each other and with the PDF narrative (Eastern/Central appeared as both rank 1 and rank 2; scores differed in the second decimal between artefacts).	NOW A single weight vector and score table now live in one file and generate every artefact. Execution simplicity is up-weighted from 0.09 to 0.14 and competitive whitespace scores are re-based against the 42,865 registered agents in Maharashtra.	WHY IT MATTERS Three artefacts disagreeing on the headline recommendation destroys the credibility of the whole system. One source, one number, everywhere.
Recommended entry corridor MODEL	WAS Narrative recommended the Eastern/Central corridor while the model ranked Navi Mumbai first — the contradiction was acknowledged but not resolved.	NOW Eastern/Central ranks first on the corrected model (8.00) and the narrative agrees with it. Thane is second (7.68) because it is contiguous with the pilot belt and Metro 4 links them. Navi Mumbai and the Western Suburbs tie on 7.48; the tie is broken toward Navi Mumbai on competitive whitespace, and the tie is shown rather than hidden.	WHY IT MATTERS The model and the recommendation must agree, or one of them is decoration. Where the model genuinely cannot separate two options, saying so is more useful than inventing a third decimal.
Yield mechanics in the workbook [SRC-028]	WAS Locality scorecard used a 650 sqft carpet placeholder against a Rs 75,000 rent, producing gross yields of 4.2–5.8% for Powai.	NOW Portal and market evidence puts prime Eastern-corridor gross yields at roughly 2.5–3.5%, and 3.4–4.8% in Thane and Navi Mumbai.	WHY IT MATTERS A yield figure inflated by around 40% would mislead an investor client on the very first screen. Placeholders must be labelled and must sit inside a plausible band.
Revenue model detail [SRC-012] [SRC-024]	WAS 'Brokerage/advisory first' with no rate, mix, lag or tax treatment.	NOW Commission conventions, a segment mix, payout lags, 18% GST and 2% TDS under 194H are now modelled explicitly, with a funnel in three scenarios and a runway curve.	WHY IT MATTERS Without a cash model, 'revenue-first' is a slogan. The runway curve is what tells the founder how much capital the plan actually needs.
Workload allocation MODEL	WAS One chart of Year-1 effort shares.	NOW A 55-hour weekly capacity budget allocated across six workstreams for twelve months, plus a week-by-week 90-day plan with hours attached to every line.	WHY IT MATTERS 'Divide the work' means naming the hours. A plan that does not fit inside a week is not a plan.

A The market

What is verifiably true about Mumbai residential property in August 2026 — demand, supply, absorption, price, infrastructure — and what each fact implies for a desk with one person and no reputation.

A1 Market at a glance — H1 2026

A2 The registration engine, month by month

A3 Overhang and the shape of demand

A4 Micro-market asking-price ladder

A5 Price against yield across MMR

A6 Infrastructure status ladder

A7 MMR strategic coverage map

A8 From market size to reachable pool

A1 · Mumbai residential market at a glance

Six numbers define the operating environment. Read them as a pair of opposing forces: demand is stable and record-deep by registration count, while the unsold pool is the largest in the country and still growing. A market that is both busy and over-supplied is a market where the buyer needs help choosing — which is exactly the service being sold.

Mumbai residential market at a glance — H1 2026

Demand is stable and record-deep by registration count; supply is running slightly ahead of it; the unsold pool is the largest in India. That combination is why selection and negotiability, not price forecasting, is the sellable skill.

Sources: Knight Frank India Real Estate H1 2026 [SRC-004, SRC-032]; Knight Frank / IGR registration coverage [SRC-005]. All figures are published market statistics, not analyst estimates. Average price is a city-wide weighted figure on the publisher's own area basis — it is context, never a comparable for a specific unit.

What to do with this. Do not use the ₹36,881 average price with a client; it is a city-wide weighted figure on the publisher's own area basis and it describes no actual flat. Use the volume and absorption figures

to establish that the market is worth working, then move immediately to pocket-level evidence you have derived yourself. The gap between this page and a defensible pocket comparable is the entire product.

A2 · The registration engine

Consultancy reports arrive twice a year. Registrations arrive every month, and each one is a dated, addressable, public instrument naming a property, a consideration and a date. This is the highest-value public dataset in the Mumbai market and it is free to search.

The registration engine — Mumbai (BMC jurisdiction), calendar 2026

Roughly 13,000–14,000 registrations clear every month and each one is a dated, addressable, public transaction record.

This monthly cadence — not the half-yearly consultancy report — is the heartbeat a micro-market desk should run on.

replace each with the monthly Knight Frank / IGR release as it is published. Two measures on different scales are shown as two panels, never as one dual-axis chart.

Operating implication. The IGR e-Search facility is free and covers Mumbai from 1985 [SRC-015]. Build the monthly sweep of your pocket set into the calendar from week 4 and never miss one — twelve months of consistent collection produces a registered-price series for your twenty-five pockets that no

competitor has bothered to build. Note that e-Search results are explicitly uncertified; for any number that will be used in a negotiation, obtain the certified copy from the sub-registrar office.

A3 · Overhang and the shape of demand

Two facts that must be held together. Mumbai holds thirty per cent of the unsold stock of India's eight largest markets. At the same time the mix is moving upmarket — homes above ₹1 crore rose from 49% to 54% of sales in a year — while the size mix stays compact, with 81% of registrations at 1,000 sq ft or less.

Overhang and the shape of demand

Mumbai carries 30% of the unsold stock of India's eight largest markets. At the same time the ticket mix is moving upmarket while the size mix stays compact — the market is paying more per square foot for the same small flat.

The modal deal, and therefore the desk. A flat of 500–1,000 sq ft carpet, above ₹1 crore, in a suburb. That is what the client-fit engine should be tuned for, what the comparable set should cover, and what

the pocket briefs should be about. Building capability for ₹8-crore sea-facing apartments is building for a market that will not call you for three years.

A4 · Micro-market asking-price ladder

Eighteen MMR micro-markets by observed asking range. The width of each bar carries more information than its position: dispersion inside a single locality is routinely 30–50%, and explaining that dispersion is what a pocket-level advisor is paid for.

MMR micro-market asking-price ladder

Portal asking aggregates, August 2026. The bar is the observed range, not a single price — and the range is the point: dispersion inside one locality is routinely 30–50%, which is exactly the gap a pocket-level desk is paid to explain.

Source: portal asking-price aggregates [SRC-027]; city average [SRC-004]. CONFIDENCE: LOW — every bar on this chart is an asking price, the area basis is not declared by the publisher, and listings are neither deduplicated nor aged.

Use this chart to triage corridors and nothing else. No number here may reach a client without being re-derived from IGR registered instruments on a declared carpet-area basis with the sample size shown.

Confidence: LOW, and it matters. Every bar here is an asking price scraped from portal aggregates whose area basis is undeclared [SRC-027]. Two of the sources consulted disagree about Chembur by roughly 40% — that conflict is retained and flagged rather than averaged away, per provenance rule 7.

This chart is for corridor triage only. No number on it may reach a client without being re-derived from registered instruments on a declared carpet basis with the sample size shown.

A5 · Price against yield

Capital value and rental yield move in opposite directions across MMR with near-perfect consistency. Prime Mumbai yields 2–3%; Thane and Navi Mumbai reach 4–5% on asking figures [SRC-028]. The line is not the insight — everyone knows the line exists.

Price against yield — the investor's trade-off across MMR

Capital value and rental yield move in opposite directions across the region with near-perfect consistency.

An advisory desk earns its fee by knowing where a specific pocket sits off this line, not by repeating that the line exists.

The advisory proposition, stated precisely. Two flats in the same pocket, sitting on the same point of this line, can differ by 15% in realised price because of floor, view obstruction, society rules, sinking-fund position, maintenance burden and true door-to-door commute. Nobody publishes that. It has to be

walked, asked and written down. Note also that these are gross yields on asking rent; net yield after maintenance, vacancy and property tax is materially lower, and net is the only figure that should ever be shown to an investor client.

A6 · Infrastructure status ladder

Ten assets that developers cite in marketing, ranked by how real they are to a buyer deciding this quarter. Metro Line 3 is fully commissioned; NMIA has run around the clock since February 2026 and now carries international services; Metro 2B, 4/4A and 6 are all in 2026 commissioning windows; Metro 8 and the Virar–Alibaug corridor are approvals with a 2030+ horizon.

Infrastructure status ladder — weight by what is running, not by what is announced

Every asset below is real. They are not equally real to a buyer deciding this quarter. The bar length is the scoring weight this system assigns, and it collapses hard as an asset moves from operating to merely approved.

The most common analytical error in Indian real-estate research is scoring an announced asset and an operating asset identically. The weight column is the correction: an operational asset carries 1.00, a commissioning one 0.75, construction 0.45–0.60, and a mere approval 0.25–0.30. The schema enforces

it by requiring status , target_date , slippage_months and last_verified on every infrastructure record, and by downgrading any asset whose target has moved twice.

A7 · MMR strategic coverage map

A schematic of entry sequence, not geography. Relative position and adjacency carry meaning; distances and boundaries do not. Phase numbers follow the corrected entry model exactly, and each phase carries a trigger rather than a date.

MMR strategic coverage map — phasing, not geometry

A schematic of how the region is entered, in what order and on what trigger. Relative position and adjacency are meaningful; distances and boundaries are not. Production mapping must use verified GIS boundaries and coordinates.

Phase order is the output of the corrected entry model in section B3, not a geographic judgement. Phase numbers denote sequence, and each carries a trigger rather than a date. Infrastructure spines shown are indicative alignments for orientation only [SRC-007 to SRC-010, SRC-029].

On mapping honestly. This is deliberately drawn as a schematic because inventing boundary geometry is a data-integrity failure dressed up as a design decision. Production mapping — the kind that goes in front of a client — must use verified GIS boundaries and real coordinates from BMC, MMRDA or CIDCO

sources. A hand-drawn polygon labelled 'Powai' will eventually be used to answer a question about whether a specific building is inside it, and it will answer wrongly.

A8 · From market size to the pool one desk can reach

The distance between the headline market and realistic Year-1 revenue is nearly four orders of magnitude. Eighty thousand city registrations become roughly fifteen reachable closures.

From market size to the pool one desk can actually reach

The funnel from headline market to realistic Year-1 revenue spans nearly four orders of magnitude. Every strategy document that stops at the first bar is selling optimism; the only number that matters is the one at the bottom.

At a ₹2.4 crore average consideration and 1% per side, 15 closures is roughly ₹36 lakh of gross commission.

That is the entire Year-1 prize for a single-founder desk, and every cost in this plan must fit inside it.

Registration base [SRC-005]. Corridor share, pocket share, intermediation rate and the reachable-closure figure are ANALYST ASSUMPTIONS, not observed statistics — they are the first four numbers the 90-day pilot exists to replace.

Measure each one directly from IGR sub-registrar data and your own funnel before planning Year 2.

Four assumptions, and the plan to remove them. The corridor share, the pocket share, the intermediation rate and the reachable-closure count are all analyst estimates **MODEL**. Each can be measured directly: corridor and pocket share from IGR by sub-registrar office within the first month;

intermediation rate from broker interviews and your own observed deals; reachable closures from your own funnel by day 90. Replacing these four numbers with observations is the single highest-value analytical task in the pilot.

B The business

What is actually being built, how the layers depend on each other, which corridor to enter first, whether that recommendation survives being wrong about the weights, and what defensible position exists for a new entrant among 42,865 registered agents.

B1 The six-layer operating stack

B2 Market entry priority — the corrected model

B3 Sensitivity: does the recommendation survive?

B4 Corridor scorecard

B5 Corridor profiles — the three in contention

B6 Competitive positioning

B1 · The six-layer operating stack

Six layers, each with a distinct economic role. Layer 1 is the licence to operate, layer 2 is the reason to be believed, layer 4 pays for everything, and layer 5 is the only one that compounds.

The six-layer operating stack

Layers 1 and 2 are the licence to operate and the reason to be believed. Layer 4 pays the bills in Year 1.
Layer 5 is the only one that compounds — and it is a by-product of layer 4, which is why transactions cannot wait for the database.

The sequencing correction that matters: layers 1, 2 and 4 are built in parallel from week 1, not in series. A brokerage that completes its database before taking a client learns nothing about whether the database helps, and runs out of money finding out. Compliance [SRC-001, SRC-002, SRC-023] gates only the marketing and closure steps, not the research.

The sequencing correction. Version 1 presented these as a ladder to be climbed. They are not. Layers 1, 2 and 4 are built simultaneously from week 1, with the compliance gate as the only hard dependency between them. A brokerage that completes its database before taking a client learns nothing about

whether the database helps — and runs out of money finding out. Layer 5 deserves particular attention: it is a by-product of doing layer 4 properly, it cannot be bought or hired, and it is the only asset in this business that a better-funded competitor cannot simply purchase.

B2 · Market entry priority — the corrected model

Seven weighted criteria, one weight vector, one score table, generating every artefact. Bars are stacked by contribution so it is always visible which criterion is carrying a corridor.

Market entry priority — the corrected model

Seven weighted criteria, one weight vector, one score table. Bars are stacked by contribution, so it is always visible which criterion is carrying a corridor — and where two corridors are genuinely inseparable.

THIS IS AN ANALYST MODEL, NOT A MARKET STATISTIC. Scores are 1-10 judgements informed by the evidence in Part A; the weights encode one specific strategy — a single founder, limited capital, needing a first closure inside two quarters. Change that strategy and the weights should change with it. Whitespace scores are re-based against the 42,865 registered agents in Maharashtra [SRC-025].

Three corrections from version 1. First, the workbook, the CSV and the PDF narrative disagreed with each other on both scores and rank; there is now one source. Second, execution simplicity is up-weighted from 0.09 to 0.14 — for a single founder with no team, travel time and site access are not a minor consideration, they are the binding constraint. Third, whitespace scores are re-based against the

42,865 registered agents in Maharashtra [SRC-025], which moves the Western Suburbs down sharply. The tie between Navi Mumbai and the Western Suburbs at 7.48 is shown rather than hidden behind a third decimal place.

B3 · Does the recommendation survive being wrong?

Two stress tests. Left: each weight doubled and halved in turn, showing Eastern/Central's remaining lead over the runner-up. Right: 5,000 weight vectors with every weight jittered $\pm 50\%$ simultaneously.

Does the recommendation survive being wrong?

Two stress tests on the entry model. Left: each weight is doubled and halved in turn. Right: 5,000 random weight vectors.

A recommendation that only holds at one exact set of weights is not a recommendation — it is an accident.

Reading: Eastern/Central stays first under every single-weight perturbation tested, and wins a large majority of randomised weight vectors. The corridors that displace it are those that win when transaction depth alone is weighted very heavily — which is precisely the strategy a well-capitalised incumbent should run, and precisely the one a single founder cannot.

Why this page exists. A weighted scoring model with hand-chosen weights is an opinion with arithmetic attached. The only way to know whether it is a robust opinion is to break it deliberately. Eastern/Central survives every single-weight perturbation tested and wins 99% of randomised weightings. The

corridors that displace it are those that win when transaction depth alone dominates — which is exactly the strategy a well-capitalised incumbent should run, and exactly the one a single founder cannot. That is a useful finding, not a caveat.

B4 · Corridor scorecard

The same 1–10 judgements as the model, laid out so the shape of each corridor is visible rather than collapsed into a single number. Read rows for a corridor's profile, columns for who wins each criterion.

Corridor scorecard — where each corridor is strong and where it is not

The same 1–10 judgements as the model, laid out so the shape of each corridor is visible rather than collapsed into one number. Read the rows for a corridor's profile; read the columns for who wins each criterion.

Analyst judgements, not measurements [model]. Read alongside B2: a corridor can lead a heavily weighted column and still lose overall. The Western Suburbs win transaction depth outright with a 10 and still finish fourth, because a 4 on whitespace is what a new entrant actually experiences on their first day of calling.

The instructive row is the Western Suburbs. They win transaction depth outright with a 10 — the deepest deal flow in the region by a wide margin — and still finish fourth, because a 4 on competitive whitespace is what a new entrant actually experiences on their first day of calling. A corridor can lead

the most heavily weighted column and still be the wrong place to start. That is the difference between a market assessment and an entry strategy.

B5 · Corridor profiles — the three in contention

Shape matters more than area. Eastern/Central has no axis below 7. Navi Mumbai is a spike — a 10 on infrastructure and a 6 on execution. Thane is the balanced value option, strongest on entry cost.

Corridor profiles — the three corridors actually in contention

The shape matters more than the area. Eastern/Central has no weak axis; Navi Mumbai is a spike on one axis; Thane is the balanced value option. A single founder should prefer the shape with no hole in it.

EASTERN / CENTRAL

No axis below 7. Nothing about it is spectacular and nothing about it will stop you. That is the correct profile for a first corridor.

THANE

Best entry cost in the region (9) and equally strong whitespace, held back only by execution friction and thinner data coverage.

NAVI MUMBAI

A 10 on infrastructure and a 6 on execution. The highest-upside corridor and the one most likely to consume a founder's calendar.

Analyst judgements [model]. The Western Suburbs, Harbour and South Mumbai are omitted here because the model does not place them in contention for a first corridor — their profiles appear in full in B4.

Prefer the shape with no hole in it. A single founder cannot compensate for a weak axis by allocating a specialist to it. Navi Mumbai's infrastructure story is the strongest in the region and genuinely observable rather than forecast — NMIA has been operating since December 2025 — but it sits behind a

creek crossing and separate civic jurisdictions (CIDCO, NMMC, Panvel), each with different field definitions and record access. That is the 6 on execution, and for a one-person desk in Year 1 it is decisive.

B6 · Competitive positioning

Two axes decide who wins a Mumbai buyer: how much evidence sits behind the advice, and how broad the geographic coverage is. Scale players own the top-left. Traditional brokers own the bottom-left. The bottom-right — deep evidence, narrow geography — is thinly held.

Competitive positioning — the gap a new desk can occupy

Two axes decide who wins a Mumbai buyer: how much evidence sits behind the advice, and how deep the geographic focus goes. Scale players own the top-left. Traditional local brokers own the bottom-right. The top-right is thinly held.

Positions are analyst judgements [model]; bubble size is indicative of market presence, not measured share. Agent count [SRC-025]; proptech market structure [SRC-026].

Why the gap is open, and why that is not comforting. Portals monetise listings rather than outcomes; scale brokerages cannot hold pocket-level detail across a 40-lead book; local brokers hold the knowledge but never write it down, so it dies with the relationship; institutional research stops above the

retail buyer. The position is open. It is also open because it is hard and slow, not because nobody thought of it — it is defended by patience rather than by capital, which is a real moat but a cold one.

C The work

The flow of work end to end, decomposed into twenty-four assignable packages, costed in hours against a real weekly capacity, and scheduled against gates rather than dates. This is the part of version 1 that existed only as a list of week numbers.

C1 The operating flow — six stages

C2 Work breakdown structure — 24 packages

C3 The Year-1 hour budget

C4 The 90-day pilot, week by week

C5 Twelve-month schedule

C6 The operating week

C7 Decision gates

C1 · The operating flow

Six stages from raw source to proprietary evidence. Each has a named input, a named output and a rule that must hold before work moves on. The loop from stage 6 back to stage 1 is the only part of the system that gets more valuable the longer it runs.

The operating flow — what actually happens, in order

Six stages. Every stage has a named input, a named output and a rule that must hold before work moves on.

Stage 6 is the one most brokerages never build, and it is the only stage that makes the next cycle cheaper than the last.

THE COMPOUNDING LOOP · every visit, objection and closure re-enters at stage 1 as a proprietary observation no competitor holds

This is the only part of the system that gets more valuable the longer it runs. It costs nothing extra to build — it costs discipline to not skip.

The correction against the uploaded blueprint: stages 1–4 and stages 5–6 are not sequential phases of the business — they run concurrently from month 1, with the compliance gate as the only hard dependency. Building stages 1–4 to completion before starting stage 5 is what turns a brokerage into an unfunded data project. Compliance basis: [SRC-001, SRC-002].

Where the compliance gate sits. Stages 1 to 4 — acquisition through interpretation — are lawful research from day one. Stages 5 and 6 involve dealing, advertising and brokerage of registered projects and cannot begin until MahaRERA registration and the Certificate of Competency are both in hand

[SRC-001, SRC-002]. This is the only hard dependency in the whole flow, and everything else runs concurrently.

C2 · Work breakdown structure

Six workstreams decomposed into twenty-four work packages, each small enough to be finished, dated and handed to someone else. Percentages are each workstream's share of the Year-1 hour budget, computed from the model on the next page rather than assigned by opinion.

Work breakdown structure — the venture decomposed to assignable packages

Six workstreams, twenty-four work packages. Each package is small enough to be finished, dated and handed over. The percentage is that workstream's share of the 2,860 Year-1 founder-hours budgeted in C3.

COMPLIANCE & ADMIN 299 h · 5 packages 10%	1.1 MahaRERA agent registration Application, fee, documents, ID issued
	1.2 Certificate of Competency 20-hour programme + exam through an empanelled partner
	1.3 Entity, tax and banking Structure, PAN/TAN, GST position, current account, CA engaged
	1.4 Data governance (DPDP) Notice, consent, purpose limits, retention, breach drill
	1.5 Recurring compliance calendar Half-yearly report, GST/TDS cycle, renewals, ad approvals
DESK RESEARCH 702 h · 6 packages 25%	2.1 Corridor and pocket definition 6 localities, 20–30 pockets, verified boundaries, frozen
	2.2 Statutory project register MahaRERA extract for every in-scope project
	2.3 Price truth engine Registered / asking / RR separated, with basis and n
	2.4 Rental layer Rents, deposits, maintenance, restrictions, vacancy proxies
	2.5 Infrastructure register Status ladder, targets, slippage, catchments
	2.6 Risk register (geographic) Title, flood, CRZ, redevelopment, oversupply
FIELD INTELLIGENCE 511 h · 4 packages 18%	3.1 Site visit programme Every project in the pocket set, physically seen
	3.2 Broker and counterparty network 3 reliable counterparties per locality
	3.3 Commute and liveability audit 3 time windows, measured not advertised
	3.4 Negotiability log Ask, revised quote, incentives, last closed comparable
DEMAND GENERATION 511 h · 4 packages 18%	4.1 Persona and channel map Who buys here, and where they can be reached
	4.2 Referral engine Alumni, professional, CA/lawyer/lender, post-close ask
	4.3 Pocket brief publishing Weekly one-pager, compliant artwork, tracked
	4.4 Channel partnerships Co-broking terms, developer registrations
DEAL EXECUTION 511 h · 4 packages 18%	5.1 Client-fit and shortlist Hard filters, weighted factors, ranked output
	5.2 Visit and negotiation cycle Accompanied visits, offers, counters, incentives
	5.3 Documentation and closure Diligence with counsel, loan, registration, handover
	5.4 Post-close and referral Support, evidence capture, referral conversion
SYSTEM & TOOLING 325 h · 4 packages 11%	6.1 Schema and identifiers Immutable IDs, enums, required fields, versioning
	6.2 Workbook, CRM and calculators One tool, used on every live lead
	6.3 Data health and freshness Staleness, conflicts, coverage, confidence reporting
	6.4 Automation and monitoring Change alerts on permitted sources — checks, not judgement

Shares are computed from the Year-1 hour budget in C3, not assigned by opinion. Twenty-four packages is the point: work that cannot be named at this granularity cannot be scheduled, cannot be dropped deliberately, and cannot be handed to a first hire.

Why granularity at this level matters. Work that cannot be named as a package cannot be scheduled, cannot be deliberately dropped when the week is short, and cannot be handed to a first hire. 'Do market research' is not a work package; '2.3 Price truth engine — registered, asking and RR separated with

basis and n' is. When month 7 arrives and deal execution needs sixteen hours a week, you will drop packages — and it matters enormously whether you drop 2.6 or 2.3.

C3 · The Year-1 hour budget

One founder, 55 working hours a week, 52 weeks: 2,860 hours in total. That is the entire resource. The shape of the stack is the strategy — research-heavy at the start, deal-heavy by the middle, and never zero on compliance.

The Year-1 hour budget — 55 hours a week, allocated

One founder, 55 working hours a week, 52 weeks: 2,860 hours in total. This is the whole resource.

The shape of the stack is the strategy: research-heavy at the start, deal-heavy by the middle, and never zero on compliance.

A planning model [model]. Read the three lines that matter: desk research falls from 18 h to 10 h a week as the corridor is exhausted; deal execution rises from zero to 16 h and stays there; compliance never reaches zero, and spikes again at month 12 for the half-yearly filing and renewals [SRC-018]. Any week where deal execution is zero after month 5 is a week the plan has failed.

Read the three lines that matter. Desk research falls from 18 hours a week to 10 as the corridor is exhausted — if it does not fall, the corridor was too big. Deal execution rises from zero to sixteen hours and stays there. Compliance never reaches zero and spikes again at month 12 for the half-yearly filing

and renewals [SRC-018]. **This is a budget, not a description.** Its purpose is to be violated visibly: any week after month five where deal execution is zero is a week the plan has failed, and the chart exists so that failure is noticed in week one rather than quarter three.

C4 · The 90-day pilot, week by week

Twenty-four scheduled items across twelve weeks, each carrying its expected hours, its concrete output and the gate that closes it. The compliance gate at week 6 is marked on every row.

On the unallocated remainder. Scheduled hours run well below 55 in most weeks, and that is deliberate. Mumbai traffic, a seller who reschedules, a bank that wants one more document, a client who calls at 21:00 — these consume the difference every week without exception. A plan that schedules 55 of 55 hours does not survive week one; it just fails invisibly and then gets abandoned as unrealistic when the failure was in the planning, not the market.

C5 · Twelve-month schedule

Sixteen workstreams over twelve months. Every bar ends at a diamond, and the diamond is a gate — a written test — rather than a date.

Twelve-month schedule — every bar ends at a gate, not a date

A date is a hope; a gate is a test. Each workstream closes when its gate is satisfied, and the workstreams that follow it are not permitted to start early to make the chart look busy.

Diamonds mark the gate, not the deadline. Expansion into corridor 2 begins at month 8 only if the corridor-1 economics have repeated; if they have not, months 8–12 are spent making corridor 1 work rather than adding a second place to be mediocre.

The expansion bars are conditional and the chart should be read that way. Corridor 2 opens at month 8 only if corridor-1 economics have repeated; if they have not, months 8–12 are spent making corridor 1 work rather than acquiring a second place to be mediocre. A Gantt chart that shows expansion as

inevitable is a Gantt chart that will be followed off a cliff, which is why the gate text sits beside every single bar.

C6 · The operating week

A steady-state week from month 6 onward: 51 committed hours across six workstreams, with four hours held in reserve. This is what the hour budget looks like when it hits a calendar.

The operating week — month 6 onwards

The plan has to survive contact with a calendar. This is one steady-state week: 55 committed hours, with the blocks that produce revenue protected from the blocks that merely feel productive.

An illustrative steady-state week [model]. The structural rules it encodes are the transferable part: site visits are batched by pocket to cut travel; deal work is never scheduled after research on the same day, because research expands to fill whatever it is given; and the CRM is updated the same day, twice a week, or it is not updated at all.

Three structural rules worth keeping even if the specific grid changes. Site visits are batched by pocket, because travel is the single largest hidden cost in an MMR desk. Deal work is never scheduled after research on the same day, because research expands to fill whatever it is given and will quietly eat the selling block. And the CRM is updated the same day, twice a week — a CRM updated weekly is a

CRM updated from memory, and memory is where lost reasons go to die. Saturday is not optional: it is the highest-conversion slot in Indian residential real estate, because it is when both decision-makers in a household can see a flat together.

C7 · Decision gates

Four moments at which the plan is allowed to change: day 30, day 60, day 90 and month 8. Each has a written test, a pass route and — more importantly — a fail route.

Decision gates — the four moments the plan is allowed to change

Each gate has a written test, a pass route and a fail route. The fail routes are the important half: a plan without a defined way to stop is a plan that will be continued past the point of evidence.

Gate tests are management targets [model], not market statistics. Write the date and the answer against every checkbox — a gate that is assessed from memory is a gate that always passes.

The fail routes are the point. A plan without a defined way to stop is a plan that gets continued past the point of evidence, because at every individual moment continuing feels cheaper than admitting the

corridor was wrong. Write the date and the answer against every checkbox. A gate assessed from memory always passes.

D Economics & control

What the funnel has to deliver, what a closure is actually worth after tax, how much capital the plan needs before it turns, which nine numbers to manage, what can go wrong, and where leads come from. None of this existed in version 1.

D1 The deal funnel — three scenarios

D2 Unit economics — one closure, then a year

D3 The cash curve and capital requirement

D4 The KPI tree

D5 Risk register

D6 Lead channels

D1 · The deal funnel

Five stages, three scenarios. The base case runs 900 raw enquiries to 15 closures across Year 1 — a 1.7% end-to-end conversion, which is normal for residential brokerage and shocking to anyone who has not run one.

The deal funnel — three scenarios for Year 1

Everything downstream of this chart depends on two numbers: qualified-lead rate and site-visit conversion. They are the first two things the 90-day pilot must measure, because every plan built on assumed values is fiction.

ILLUSTRATIVE PLANNING MODEL [model]. Conversion rates, segment mix and commission rates are assumptions, not observations — replace every one of them after 30–50 qualified leads. Tax is indicative on FY2025-26 individual new-regime slabs for a proprietorship and is not advice; confirm the entity and tax position with a CA [SRC-031]. Brokerage attracts 18% GST as an output tax [SRC-012] and 2% TDS under section 194H on receipt [SRC-024]; neither is shown as a cost above because both are pass-through or creditable.

Two numbers govern everything downstream. The qualified-lead rate (27% in the base case) and site-visit conversion (46%). Both are assumptions here and both are measurable within ninety days. Note the definition being used: a lead is qualified only if budget, timeline, decision authority *and* area fit all pass.

Loosening that definition is the most common way a founder hides a demand problem from themselves for two quarters, because the enquiry count keeps rising while the visit count does not.

D2 · Unit economics

Left: the cash journey of one average closure — ₹2.30 cr consideration, 1.32% blended commission, 18% GST added and remitted, 2% TDS withheld and recoverable. Right: the Year-1 profit and loss with the founder's own time priced in.

Unit economics — one closure, then a year of them

Left: the cash journey of a single average closure, from consideration to what reaches the founder.
Right: the Year-1 profit and loss in the base case, with the founder's own time priced in.

ILLUSTRATIVE [model]. The hourly figure is the number this plan should actually be judged against: it is what the founder earns for the year's whole effort in the base case, and it is the honest comparator to a salaried alternative. In the conservative case it falls to roughly a third of that. Tax is indicative FY2025-26 new-regime individual slabs and not advice [SRC-031].

The number this plan should be judged on. ₹32.6 L post-tax for 2,860 founder-hours is about ₹1,140 an hour. In the conservative case it is roughly a third of that. Anyone considering this venture should compare those two figures honestly against their salaried alternative before week one, not after month nine. The upside argument is real — the asset being built compounds and the Year-3 economics look

nothing like Year 1 — but it should be made against an honest Year-1 number rather than instead of one. Tax shown is indicative on FY2025-26 individual new-regime slabs for a proprietorship and is not advice [SRC-031].

D3 · The cash curve

Cumulative cash from a standing start, in the base and conservative cases. The trough — not the break-even point — is the number that determines whether the plan is viable, because it is what must be in the bank on day one.

The cash curve — how much capital this plan actually needs

Cumulative cash from a standing start, before any outside funding. The trough is the number that matters: it is what must be in the bank on day one for the plan to reach its own break-even without a forced sale.

ILLUSTRATIVE [model]. Closure timing is the most fragile assumption on this page: a single closure slipping from month 5 to month 8 deepens the trough by roughly one lakh and pushes break-even out by a quarter. Payout lag is modelled at six weeks; primary-market channel payouts commonly run 60–90 days and should be tracked per counterparty from the first deal.

Raise against the conservative case. The difference between the two curves is a single assumption: whether the first closure lands in month 5 or month 7. That is not a wide range for a market where deals routinely take 60–120 days from first enquiry to registration, and the second case is at least as likely as

the first. Founder drawings are the largest line in the burn at ₹60,000 a month, so the honest first question is not 'is the market good?' — it demonstrably is — but 'how long can this household run on less?'

D4 · The KPI tree

Revenue is not a lever; it is an outcome. Nine measurable quantities produce it, grouped into volume, value and efficiency, so a bad result at the top can be traced to the branch that caused it.

The KPI tree — nine numbers, and what each one is telling you

Revenue is not a lever; it is an outcome. These are the nine measurable quantities that produce it, arranged so that a bad result at the top can be traced to the one branch that caused it.

Definitions and formulas are the operating standard for this business [model]. Two rules make the tree work: every KPI is computed from the CRM rather than from memory, and a qualified lead means all four tests passed. Loosening the definition of a qualified lead is the most common way a founder hides a demand problem from themselves for two quarters.

Two rules make the tree work. Every KPI is computed from the CRM rather than recalled, and the qualified-lead definition never moves. Watch the efficiency branch hardest: research hours per closure must fall across the year, or the intelligence layer is not paying for itself and is a hobby with a

spreadsheet. The referral coefficient above 0.5 is the point at which the business starts compounding rather than being re-sold from scratch every quarter.

D5 · Risk register

Fourteen risks positioned by likelihood and impact, ranked by severity, each with the control that addresses it and the phase in which it bites.

Risk register — likelihood against impact

Fourteen risks, positioned by how likely they are and how much damage they do. The top-right quadrant is not a watchlist; it is the set of things that must have a named control before month 1 ends.

RANKED BY SEVERITY · likelihood × impact

- 3 Founder overload crowds out selling
severity 20 · Month 3-6
- 4 Revenue arrives later than runway
severity 20 · Month 4-8
- 2 Price-basis contamination
severity 16 · Month 1
- 1 Marketing before certification
severity 15 · Month 1-2
- 6 DPDP non-compliance on lead data
severity 12 · Month 1-2
- 7 Infrastructure narrative slips
severity 12 · Continuous
- 8 Commission dispute or non-payment
severity 12 · Per deal
- 11 Lead-quality illusion
severity 12 · Month 3+
- 13 Expansion before the model repeats
severity 12 · Month 8+
- 10 Legal/title misstatement to a client
severity 10 · Per deal
- 5 Portal dependence and ToU breach
severity 9 · Continuous
- 9 Developer payout concentration
severity 9 · Month 6+
- 12 Data staleness erodes credibility
severity 9 · Continuous
- 14 Key-person illness or interruption
severity 8 · Continuous

Hard cap of 20 h/week research after month 4; the workload model is a budget, not a description

12-month runway funded before start; rental desk switched on by month 6 to cover fixed costs

area_basis and price_type mandatory NOT NULL; comparisons blocked across bases in the workbook

Hard compliance gate at week 6; no campaign asset leaves the folder before the MahaRERA number and QR code exist

Notice + consent at first capture; minimum-necessary collection; documented retention and deletion

Status ladder with slippage_months; only operational assets carry full weight in scoring

Written terms before every engagement; documented introduction trail; payout-days tracked per counterparty

Qualified lead is the KPI, defined by budget + timeline + decision authority + area fit

Expansion gate: corridor 1 must produce closures without founder presence in every step

Title opinions only from qualified counsel; unknowns flagged as unknown in writing

Manual/permitted collection only; own field observations and closed deals become the primary asset

Concentration tracked monthly; co-broking and resale kept live alongside primary

stale_after_days per domain; freshness shown on every client-facing screen

Written playbooks from day one; every process documented so it can be handed over

Likelihood and impact are analyst judgements for a single-founder start [model]. The register is only useful if it is re-scored at every decision gate: risks 1 and 6 fall away once compliance is complete, while risks 4 and 8 rise sharply the moment real money is in play. Regulatory basis for risks 1, 6 and 10: [SRC-001, SRC-002, SRC-017, SRC-018, SRC-023].

Re-score this at every gate. The register is only useful if it moves. Risks 1 and 6 — marketing before certification, and DPDP non-compliance — fall away once compliance is complete. Risks 4 and 8 — runway and commission disputes — rise sharply the moment real money is in play, and they are barely

visible in month 1 when they are cheapest to control. The top three by severity all concern the founder's own behaviour rather than the market, which is the honest finding of this exercise.

D6 · Lead channels

Eight channels by cost per qualified lead, close rate, and months to become productive. The cheapest channels are the slowest to build and the hardest for anyone to buy.

Lead channels — cost, quality, and time to become productive

The cheapest channels are the slowest to build and the hardest to buy. That is precisely why they are worth building: a referral engine cannot be outspent by a competitor, and a portal listing can be outbid by anyone, this afternoon.

Build the slow ones first. A referral engine takes months to establish and cannot be outspent by a competitor; a portal listing works this afternoon and can be outbid by anyone, also this afternoon. All figures here are planning hypotheses **MODEL** — no channel-level acquisition data exists for a business

that has not yet run. Tag every lead with its source at capture and redraw this chart at day 90 with real numbers. And note: every published brief and listing is an advertisement under the MahaRERA disclosure order and must carry the QR code and registration number [SRC-017].

E The system

The data architecture that makes the advice defensible: seven geographic levels, twelve domains, a source stack with acquisition rules, the compliance path and calendar, the client-fit engine, and the eight provenance rules that hold it all together.

E1 Geographic hierarchy — L0 to L6

E2 Data domains and staleness rules

E3 The source stack and acquisition law

E4 Compliance critical path and calendar

E5 The client-fit engine

E6 The eight provenance rules

E1 · Geographic hierarchy

The uploaded blueprint's L0–L6 structure is kept unchanged, because it is correct. What is added is the explicit designation of L4 (pocket) as the research unit and L6 (unit) as the closure unit.

Geographic hierarchy — seven levels, two that matter

The uploaded blueprint's L0–L6 structure is kept unchanged; it is correct. What is added is the explicit statement of which level is the research unit and which is the closure unit, because everything else exists only to serve those two.

Two rules follow from this structure and are enforced in the schema. First, no fact may exist without a geo_id — a price that belongs to 'Powai' generally, rather than to a named pocket, is not usable evidence. Second, aggregation only ever runs upward: an L4 pocket figure is built from L5 and L6 observations and never inherited downward from an L3 locality average. Inheriting downward is how a ₹28,000/sq ft locality average ends up quoted for a ground-floor flat facing a nullah.

Two rules enforced in the schema. No fact may exist without a geo_id — a price belonging to 'Powai' in general rather than to a named pocket is not usable evidence. And aggregation only ever runs upward: an L4 pocket figure is built from L5 and L6 observations, never inherited downward from an L3 locality

average. Downward inheritance is how a ₹28,000/sq ft locality average ends up quoted for a ground-floor flat facing a nullah, and it is the most common way an otherwise careful dataset starts producing confident nonsense.

E2 · Data domains and staleness

Twelve domains, each with the minimum fields that must exist before a record is accepted and the number of days after which the system marks it stale on every client-facing screen.

Data domains — minimum fields and staleness rules

Twelve domains, each with the fields that must exist before a record is accepted and the number of days after which the system marks that record stale on every client-facing screen. The red domains are where the work never stops.

	STALE AFTER	PHASE-1 MINIMUM FIELDS	PRIMARY SOURCES	REFRESH
Geography	365 d	geo_id, parent_geo_id, level, name, boundary_ref, analysis_role granularity: L0–L6	BMC/MMRDA/verified GIS	On change
Pricing	30 d	geo_id, project_id, price_type, area_basis, price_psf, sample_size, observed_date, source_ref granularity: L4–L6	IGR e-Search, portals, RR	Asking weekly; registered monthly; RR annual
Rental	45 d	geo_id, configuration, furnishing, asking_rent, closed_rent, deposit, maintenance, restrictions granularity: L4–L6	Portals, field, own deals	Monthly / per live deal
Projects	60 d	rera_id, promoter, configuration, inventory, possession_date, status, qpr_ref granularity: L5	MahaRERA, developer filings	Monthly / on change
Developers	120 d	promoter_id, delivery_record, avg_delay_months, complaints, litigation_ref, active_projects granularity: Promoter	MahaRERA orders, filings	Quarterly
Supply	45 d	active_listings, new_launch, absorption, qts, listing_age, availability granularity: L3–L5	Portals, consultancy research	Monthly / quarterly
Infrastructure	90 d	asset_id, status, target_date, slippage_months, catchment_geo, impact_note granularity: L1–L4	MMRDA, MSRDC, BMC, operator	Quarterly / on change
Risk	180 d	geo_id, risk_type, severity, evidence_ref, last_verified granularity: L4–L6	BMC, CRZ, MahaRERA, field	Change-driven
Demand	7 d	lead_id, source, persona, budget, timeline, authority, area_fit granularity: Lead	Own CRM	Every interaction
Deals	7 d	deal_id, stage, units_shown, visits, offers, closed_price, commission, lost_reason granularity: Deal/unit	Own CRM	Every interaction
Field	90 d	observation_id, geo_id, observation_type, value, method, observed_date, observer granularity: L4–L6	Own field programme	Continuous
Compliance	30 d	obligation_id, due_date, status, evidence_ref granularity: Entity	Own records	Continuous

The four fields the uploaded blueprint did not carry, and which this schema makes mandatory on every record: sample_size, observed_date, stale_after_days and conflict_flag. Together they answer the only question that matters when a client challenges a number — where did this come from, when was it true, how many observations support it, and what still disagrees with it?

The four fields version 1 did not carry and which are now mandatory on every record: sample_size , observed_date , stale_after_days and conflict_flag . Together they answer the only question

that matters when a client challenges a number in a negotiation — where did this come from, when was it true, how many observations support it, and what still disagrees with it? Being able to answer that in ten seconds is the entire difference between an advisor and a person with opinions.

E3 · The source stack

Four tiers. Statutory records establish what is true; institutional research establishes context at city and zone level; portals establish what is currently being asked; your own closed deals establish what actually transacted. They are not interchangeable, and confusing them is expensive.

The source stack — truth at the bottom, speed at the top

Sources are not interchangeable. The statutory layer is slow and authoritative; the observation layer is fast and unreliable; the proprietary layer is the only one a competitor cannot also buy.

HOW EACH SOURCE MAY LAWFULLY BE TAKEN

- Government portals — MahaRERA, IGR, MMRDA, BMC**
Published for public use. IGR e-Search is free and covers Mumbai from 1985, but results are explicitly uncertified — for a contested fact, obtain the certified copy.
- Institutional research reports**
Cite and attribute. Do not republish tables wholesale, and never present a consultancy's city-level figure as if it described your pocket.
- Property portals**
Terms of use are enforceable as contract in India, and clickwrap acceptance binds you. Collect manually or through a permitted feed or API. Do not build the business on a scraper you would not describe to the portal.
- Anything containing personal data**
The DPDP Rules were notified in November 2025 and phase in to roughly mid-May 2027. Consent obligations extend to personal data that is already public. There is no small-business exemption and penalties reach ₹250 crore.
- Your own field notes and closed deals**
Yours outright, and the only category that is. This is the argument for capturing every observation the moment it happens.

Acquisition positions are practical guidance, not legal advice [SRC-015, SRC-023, SRC-030]. The operating rule that follows: the statutory layer establishes what is true, the signal layer establishes what is currently being asked, and only the proprietary layer establishes what actually closed. Confusing the three is the most expensive mistake in this business.

On acquisition, practically. Government portals are published for public use. Institutional reports should be cited, not republished. Portal terms of use are enforceable as contract in India and clickwrap acceptance binds you [SRC-030] — collect manually or through a permitted feed, and do not build the

business on a scraper you would not describe to the portal in a meeting. Anything containing personal data falls under the DPDP Rules, which extend consent obligations even to personal data that is already public, with no small-business exemption [SRC-023].

E4 · Compliance path and calendar

Above: the six-week critical path from application to the moment marketing may lawfully begin. Below: the recurring obligations across an Indian financial year, which do not stop once the path is complete.

Compliance — the critical path, then the calendar that never stops

The Certificate of Competency became mandatory in January 2026 and it is the longest-lead item in the entire venture. Nothing that looks like marketing may happen before it is issued, and the obligations do not end when it is.

CRITICAL PATH · roughly six weeks, and it cannot be compressed by working harder

THE RECURRING CALENDAR · Indian financial year, April to March												
	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar

Registration / certificate renewal												•

★ major filing

▲ statutory deadline

• routine discipline

Every one of these is a diary entry with a named owner and an evidence file, from week 1.

Compliance discovered in month 9 is compliance already breached.

Registration and certification [SRC-001, SRC-002, SRC-003]; advertisement QR and disclosure [SRC-017]; half-yearly agent reporting [SRC-018]; GST registration threshold and rate [SRC-011, SRC-012]; TDS under sections 194-IA and 194H [SRC-024]; DPDP obligations [SRC-023]. Timing is indicative and statutory dates change — confirm each with a CA and re-verify against the source before relying on it.

This page is the one to print and pin up. The Certificate of Competency requirement that took effect in January 2026 is the longest-lead item in the venture and cannot be compressed by working harder [SRC-002]. Book the training slot in week 1, before the market research, before the corridor is even

chosen — the research can happen while you wait, but nothing can happen if you have not started the clock. Every item in the lower panel is a diary entry with a named owner and an evidence file from week 1; compliance discovered in month 9 is compliance already breached.

E5 · The client-fit engine

A shortlist is produced by elimination and only then by scoring. Five hard filters remove units permanently; what survives is ranked on six weighted factors.

The client-fit engine — hard filters first, weights second

A shortlist is produced by elimination, not by scoring. Anything that fails a hard filter is removed and never re-ranked back in; only what survives is scored. Reversing that order is how a broker talks a client into a flat they cannot legally or financially hold.

Transaction-cost rates: stamp duty and registration [SRC-013]; TDS under section 194-IA [SRC-024]; GST on brokerage [SRC-012]. The worked example uses the modelled average consideration and is illustrative. Getting this table right on a client's first call is the cheapest credibility available to a new advisor — most buyers arrive having budgeted for the agreement value alone.

The all-in cost table is the cheapest credibility available to a new advisor. Most buyers arrive having budgeted for the agreement value alone. Stamp duty at 6% for a male buyer or 5% for a sole female owner — both including the 1% metro cess — plus 1% registration capped at ₹30,000, plus 1% TDS under section 194-IA above ₹50 lakh, plus brokerage with 18% GST, adds roughly 8% to the transaction

[SRC-013, SRC-024, SRC-012]. Getting this right on the first call, unprompted, does more for trust than any amount of market commentary. Note also that the 15-year resale lock-in formerly attached to the women's concession was removed in 2026.

E6 · The eight provenance rules

The rules version 1 got right, preserved intact, each now paired with the specific failure it exists to prevent.

The eight provenance rules — and the specific failure each one prevents

These are the rules the uploaded blueprint got right, kept intact, with the failure mode each one exists to stop written next to it.
A rule without a named failure mode gets negotiated away the first time it is inconvenient.

1. AREA BASIS Every price declares carpet, built-up or saleable. Comparison across bases is blocked, not warned. PREVENTS: A saleable-area price compared to a carpet price understates the true rate by 25–35%. This single error can make a bad flat look like the cheapest on the shortlist.	2. PRICE TYPE Asking, registered, Ready Reckoner and launch are four separate fields, never one column. PREVENTS: Asking prices in Mumbai routinely sit 8–15% above registered values. Blending them produces a number that describes no transaction that has ever occurred.
3. PROVENANCE Every fact carries source_ref, observed_date and confidence. No exceptions, including your own notes. PREVENTS: Without it you cannot answer 'where did that come from?' in a live negotiation, and the entire advantage of being evidence-led evaporates in one sentence.	4. SAMPLE SIZE Every aggregate shows n. Below the domain minimum it is visually downgraded, not hidden. PREVENTS: A pocket 'average' built on two transactions is an anecdote wearing a decimal point.
5. STATUS LADDER Confirmed / approved / under construction / proposed / rumoured, with slippage_months tracked. PREVENTS: An approved metro line and an operating one produce completely different buyer behaviour. Scoring them alike is the most common error in Indian micro-market research.	6. MISSING DATA Display 'Data unavailable'. Never coerce to zero, never interpolate, never estimate silently. PREVENTS: A zero propagates into every average downstream and is invisible once it does.
7. CONFLICTS Retain both values, flag the conflict, and show it until it is reconciled against a primary source. PREVENTS: Two portals disagreeing by 30% on the same project is information about the market, not an error to be averaged away.	8. STALENESS Each domain has stale_after_days. Client-facing screens show freshness on every number. PREVENTS: A price that was true in March, quoted in August, in a market moving 5–6% a year, is simply wrong.

Rules 1–8 are preserved from the uploaded blueprint, which had them right. What is added here is enforcement: each rule is a NOT NULL constraint or a blocked operation in the workbook rather than a convention in a document. A data-quality rule that depends on the founder remembering it at 22:00 on a Friday is not a rule.

What is added is enforcement. Each rule is implemented as a NOT NULL constraint or a blocked operation in the workbook, not as a convention described in a document. A data-quality rule that

depends on the founder remembering it at 22:00 on a Friday, three hours before a client meeting, is not a rule — it is an aspiration, and it will be the first thing to go.

F Playbooks

The five operating procedures that turn the system into a service: how to verify a pocket in the field, how to run a first client conversation, how to negotiate with evidence, what to check before closure, and how to convert a closed client into the next two.

F1 Field research protocol

F2 The first client conversation

F3 Negotiation playbook

F4 Documentation and closure

F5 Post-close and the referral flywheel

F1 · Field research protocol

Eight things that must be verified on foot for every pocket in the set, the method for each, and the business reason it exists. Three independent inputs per locality is the standard; a single broker's word is a hypothesis, not a finding.

VERIFY	METHOD AND STANDARD	WHY IT EXISTS
True commute	Three time windows: 08:15–09:30, 13:00, 19:00–20:30. Door to office door, by the mode the client will actually use. Record the route and the date, not just the minutes.	Advertised distance systematically understates time. A 9 km commute in Mumbai can be 25 minutes or 75.
Society restrictions	Society office and security, plus two independent broker confirmations. Ask specifically: non-vegetarian, pets, bachelors, unmarried couples, religion, parking allotment, guest policy.	Restrictions invalidate client fit entirely and are rarely disclosed until the offer stage. Note that some restrictions raise legal and fair-dealing questions — record what the society states, advise the client factually, and do not become the instrument of an unlawful exclusion.
Maintenance and sinking fund	A recent bill from an owner, cross-checked with a second owner and a broker. Ask about pending major repairs and any special levy under discussion.	Maintenance changes affordability and destroys net yield. A ₹12,000 monthly charge on a ₹75,000 rent is 16% of gross before vacancy and tax.
Inventory truth	Developer, two brokers, portal listings and your own site observation, on the same day.	Phantom and duplicated inventory is the norm on portals. A unit listed by four brokers is one unit.
Negotiability	Initial ask, revised quote after a serious enquiry, incentives offered, and the last closed comparable from IGR. Log the date of each.	Discount-to-close is the single most useful proprietary number you will build, and no public source has it.
Micro-pocket quality	Walk it. Noise, access road width, waterlogging marks on compound walls, walkability to transit, view obstruction from the specific floor, afternoon sun.	This explains most of the 30–50% price dispersion inside a single locality, and it cannot be desk-researched.
Developer execution	Construction progress against the RERA quarterly progress report, plus the promoter's delivery record on prior projects.	Possession delay is the largest single source of buyer regret in under-construction purchases.
Resident and tenant context	Non-sensitive observation and voluntary conversation only: household composition patterns, commute destinations, school catchment use.	Demand fit can be understood without unlawful profiling. Capture property-relevant facts, never protected characteristics, and never use them as filters.

THE RULE THAT MAKES FIELD WORK COMPOUND

Record it the same day, in the system, with the date and the method — not in a notebook, not in your head, not in a WhatsApp thread. Field intelligence that is not written down within twenty-four hours is field intelligence that will be re-collected in six months, at full cost, having in the meantime been unavailable to every client who needed it.

F2 · The first client conversation

Forty-five minutes, structured. The objective is not to show inventory — it is to establish the four qualification tests, surface the constraints the client has not thought about, and demonstrate in passing that you know things the last three brokers did not.

The four qualification tests

Budget	All-in, not agreement value. Walk them through the 8% transaction stack on the spot — stamp duty, registration, TDS, brokerage and GST. Establish the funding split and whether the loan is sanctioned or assumed.
Timeline	When do they need to move, and what is driving it — lease expiry, school admission, possession of a sold property? A client with no forcing event is a client who will look for eighteen months.
Authority	Who else decides? Spouse, parents, a sibling abroad? Find the absent decision-maker in the first meeting, not at the offer stage.
Area fit	Does the requirement actually intersect your pocket set? If it does not, say so and refer it out. A referral given honestly returns; a client dragged into the wrong corridor does not.

SAY THIS OUT LOUD IN THE FIRST MEETING

"I work six localities in depth rather than the whole city. If what you need is outside them, I will tell you and introduce you to someone better placed." It costs you one client in ten and buys the credibility that closes the other nine.

What to bring, and what it signals

- **The all-in cost sheet** for their stated budget, computed live. Signals: this person does arithmetic, not enthusiasm.
- **One pocket brief** with registered comparables, sample sizes and dates — not asking prices. Signals: this person has sources.
- **The infrastructure status ladder** for their corridor, with operational assets separated from announced ones. Signals: this person will not sell you a metro line that does not exist.
- **Two things you know that they cannot look up** — a society's pet policy, a specific tower's afternoon sun, a maintenance figure. Signals: this person has walked the ground.

What to record before you leave

- All four qualification answers, verbatim where possible
- Lead source, tagged at capture — never reconstructed later
- Stated hard filters and stated preferences, kept separate
- DPDP notice given, consent recorded, purpose stated [SRC-023]
- Next action and a date. Every lead has one, always

Collect the minimum personal data necessary for the purpose, state that purpose, and delete it on the retention schedule. This is a legal obligation, not a courtesy, and it applies from the first conversation.

F3 · Negotiation playbook

Negotiation in Mumbai residential resale is not adversarial theatre; it is the orderly presentation of evidence to a seller who has usually anchored on a number they heard from a neighbour in 2023. The desk's advantage is that it can show the workings.

BEFORE THE OFFER

- Pull every registered comparable in the building and the adjacent two, twelve months back, from IGR [SRC-015]
- Normalise all of them to carpet area — never negotiate across area bases
- Establish the Ready Reckoner floor for the address; note that RR is frozen for FY2026-27 [SRC-014]
- Record days-on-market and any prior price revisions
- Check the society's transfer charges and NOC position before quoting an all-in figure

THE FOUR LEVERS, IN ORDER

- **Evidence.** Registered comparables with dates and carpet normalisation. This alone moves most sellers, because most have never seen them.
- **Certainty.** A sanctioned loan and a clean timeline is worth real money to a seller with their own purchase pending.
- **Condition and cost.** Pending society levies, deferred repairs, non-conforming alterations — priced, not complained about.
- **Terms.** Possession date, token structure, who bears the society transfer fee. Often cheaper to trade than headline price.

WHAT NOT TO DO

- Do not quote an asking-price average as if it were a market rate — the other side's broker will know.
- Do not offer an opinion on title. Flag the question and route it to counsel, in writing.
- Do not commit to a possession date the RERA quarterly progress report does not support.
- Do not discount your own brokerage to close. It re-prices every future deal and signals that the advice was never worth what you said it was.
- Do not proceed on a verbal fee understanding. Written terms before engagement, every time.

CAPTURE, ON THE SAME DAY

Initial ask · revised quote · incentives offered · final closed price · days from first offer to agreement · who moved first · the reason the seller gave. Six months of this across twenty-five pockets is a discount-to-close dataset that does not exist anywhere else, and it makes every subsequent negotiation shorter and better. This is the compounding loop from C1, in its most concrete form.

F4 · Documentation and closure

The checklist below is an operating aid for a broker coordinating a transaction, not a legal opinion. Title verification, drafting and advice on any of these documents must come from a qualified advocate engaged by the client. The broker's job is to make sure nothing is missed and nothing is misrepresented.

Before the agreement

Title chain	Advocate-led search. Prior conveyance, index-II extracts, mutation entries. Broker collects, counsel opines.
RERA position	Project registration, promoter, status and quarterly progress report for under-construction; verify against the MahaRERA portal, not the brochure [SRC-016].
Society records	Share certificate, NOC, transfer charges, no-dues, pending levies and any litigation the society is party to.
Encumbrance	Existing mortgage and the release mechanism. Confirm which lender holds the original documents and the timeline to release.
Approvals	Occupancy certificate, commencement certificate, sanctioned plan against as-built. Unauthorised alterations are a live risk.
Seller capacity	Identity, ownership, power of attorney if any, and consent of all co-owners including absent ones.

At and after execution

Stamp duty	6% male buyer, 5% sole female owner, both including 1% metro cess. Computed on the higher of consideration and Ready Reckoner value [SRC-013].
Registration	1% capped at ₹30,000. Within four months of execution.
TDS 194-IA	Buyer deducts 1% where consideration is ₹50 lakh or more; Form 26QB within thirty days of the month end. Advise it early — buyers routinely miss it [SRC-024].
Handover	Meter readings, society transfer, keys, original documents, pending dues settled and evidenced.
Your own file	Written brokerage terms, introduction trail, invoice with 18% GST, TDS at 2% under 194H reconciled to 26AS/AIS [SRC-012, SRC-024].
MahaRERA record	Log the facilitated project for the half-yearly compliance report while the detail is fresh [SRC-018].

THE LINE NOT TO CROSS

A broker may collect, organise and flag. A broker may not opine on title, draft the agreement, or reassure a client that a defect is immaterial. Where a document raises a question, the answer is "I don't know — let's put that to your advocate", in writing, that day. Overstating what the record supports is the fastest route to a claim you cannot defend, and it is risk 10 on the register.

F5 · Post-close and the referral flywheel

The closure is the beginning of the most valuable phase, and it is the phase almost every broker skips. Two things happen here: the client becomes a source of the next two clients, and the deal becomes permanent structured evidence.

The ninety days after handover

Week 1	Handover confirmation, society introduction, utility transfers. Unpaid, unglamorous, and remembered for years.
Week 3	Check-in call. Anything not working? This is where you learn what the building is actually like to live in — and that goes into the dataset.
Week 6	The referral ask, made explicitly and once: "If anyone you know is looking in Powai or Kanjurmarg, I'd value the introduction." Scripted, not hinted.
Week 12	Send them something useful and unrequested — the quarterly pocket brief for their building. Cost: nothing. Effect: you are still their broker in three years.

REFERRAL COEFFICIENT ABOVE 0.5

Every two closed clients producing one new qualified referral is the threshold at which acquisition cost starts falling instead of rising. It is the cheapest channel on page 38 and the slowest to build. It is also the only one that cannot be bought by a competitor.

What the closed deal contributes to the system

- **Closed price against asking** — the discount-to-close observation that no public source holds
- **Days at each stage** — enquiry to visit, visit to offer, offer to agreement, agreement to registration
- **Every objection raised** and how it was answered, including the ones that were fatal
- **The society's actual rules** as encountered, not as advertised
- **Real maintenance and transfer charges**, from the bill
- **Counterparty response times** — which brokers, developers and lenders actually move
- **Lost-deal post-mortems**, which are worth more than the wins and are the first thing to get skipped

WHY THIS IS THE MOAT

A competitor can buy every portal subscription, hire consultants and read every published report. They cannot buy the record of what forty specific flats in your twenty-five pockets actually transacted at, why eleven buyers walked away, and which three societies quietly refuse pets. That dataset costs nothing extra to build — it costs the discipline not to skip stage 6 when the deal is done and the next client is calling.

G Appendices

The source registry with full URLs and access dates, the data dictionary, the 90-day checklist in operating form, a glossary, and the first week's instructions.

G1 Source registry — 33 sources

G2 Data dictionary

G3 The 90-day checklist

G4 Glossary

G5 What to do on Monday morning

G1 · Source registry

Thirty-three sources, each with the specific fact it supports, its refresh cadence and a confidence grade. Every source was accessed on 14 August 2026. Market and regulatory facts move — re-verify before relying on any of them.

G2 · Data dictionary

Thirty-six fields across nine tables. Required fields are enforced as NOT NULL constraints, not as documentation. The full machine-readable dictionary, along with nineteen other data files, ships in `/data/`.

TABLE	FIELD	TYPE	REQ	DESCRIPTION
geo	geo_id	text	yes	Immutable geography identifier (L0–L6). No fact exists without one.
geo	parent_geo_id	text	no	Parent geography id — enforces the upward-only aggregation rule.
geo	level	enum	yes	L0 / L1 / L2 / L3 / L4 / L5 / L6
geo	boundary_ref	text	no	Verified GIS boundary reference. Never a hand-drawn polygon.
pricing	price_type	enum	yes	asking / registered / ready_reckoner / launch — four fields, never blended
pricing	area_basis	enum	yes	carpet / built_up / saleable. Comparison across bases is blocked.
pricing	price_psf	number	yes	Price per sq ft on the declared area basis
pricing	sample_size	integer	yes	Observations behind the aggregate. Below the domain minimum, downgraded visually.
rental	monthly_rent	number	yes	Monthly asking or closed rent — price_type applies here too
rental	configuration	text	yes	1BHK / 2BHK / 3BHK
rental	furnishing	enum	yes	bare / semi / full
rental	deposit_months	number	no	Security deposit expressed in months of rent
project	rera_id	text	yes	MahaRERA project registration id, or the explicit value NOT_REGISTERED
project	possession_date	date	no	Declared possession date from the RERA filing, not the brochure
project	qpr_ref	text	no	Quarterly progress report reference and date
developer	avg_delay_months	number	no	Observed delivery slippage across the promoter's prior projects
infra	status	enum	yes	operational / commissioning / under_construction / approved / proposed / rumoured
infra	slippage_months	number	no	Cumulative delay against the earliest published target

TABLE	FIELD	TYPE	REQ	DESCRIPTION
infra	last_verified	date	yes	When the status was last checked against the source
risk	risk_type	text	yes	flood / title / CRZ / environment / litigation / oversupply / infra
risk	severity	enum	yes	low / medium / high — high is a hard filter, not a discount
fact	source_ref	text	yes	Source registry id. Mandatory on every record without exception.
fact	observed_date	date	yes	Date the fact applies to — not the date it was copied
fact	confidence	enum	yes	high / medium / low
fact	stale_after_days	integer	yes	Domain refresh rule; drives the client-facing freshness display
fact	conflict_flag	boolean	yes	Marks an unresolved disagreement between sources. Retained, not averaged.
lead	lead_id	text	yes	Lead identifier
lead	source_channel	text	yes	Tagged at capture. Reconstructing it later produces fiction.
lead	qualified	boolean	yes	True only if budget, timeline, authority and area fit all pass
lead	consent_ref	text	yes	DPDP notice and consent record reference
lead	retention_until	date	yes	Deletion date under the stated retention policy
deal	stage	enum	yes	lead / qualified / visit / negotiation / closure / lost
deal	closed_price	number	no	Actual registered consideration, from the instrument
deal	commission_realised	number	no	Realised commission, net of TDS under 194H
deal	payout_days	integer	no	Days from closure milestone to cash receipt, per counterparty
deal	lost_reason	text	no	Mandatory on any deal marked lost. No blank values accepted.

G3 · The 90-day checklist

The pilot in operating form. Print it, put a date against every gate as it closes, and do not tick a box you cannot evidence. Total scheduled: 458 hours of a 660-hour capacity across twelve weeks — the balance is reserve, and it will be consumed.

WK	GOAL	OUTPUT	GATE	HRS	DONE
W1	Legal right to operate Compliance & admin	MahaRERA application filed; training slot booked; entity, PAN/TAN, bank; CA engaged	▪ Application reference number in hand	40 h	☐
W1	Schema v1 System & tooling	Geo hierarchy L0–L6; price_type and area_basis enums; source registry; immutable IDs	▪ Every fact requires geo_id + source_ref + observed_date	15 h	☐
W2	Certification in progress Compliance & admin	20-hour training underway; DPDP notice, consent text and retention policy drafted	▪ No regulated marketing until certificate issued	12 h	☐
W2	Corridor lock Desk research	One corridor; 6 localities; 20–30 pockets named and mapped on verified boundaries	▪ Geography frozen for 90 days — written and dated	30 h	☐
W3	Statutory project register Desk research	MahaRERA extract per project: promoter, RERA id, status, QPR, possession date	▪ 100% of in-scope projects have a RERA record or an explicit 'not registered' flag	34 h	☐
W3	Data health harness System & tooling	stale_after_days per domain; conflict_flag; confidence; freshness dashboard	▪ Dashboard renders on real records, not samples	10 h	☐
W4	Price truth Desk research	Registered (IGR) vs asking (portal) vs Ready Reckoner — each with area basis and n	▪ Zero blended price types; every aggregate shows n	32 h	☐
W4	First field wave Field intelligence	8–10 site visits; 3 brokers per locality; society rules; maintenance; commute ×3 windows	▪ >=3 independent field inputs per locality	14 h	☐

G3 · The 90-day checklist · continued

WK	GOAL	OUTPUT	GATE	HRS	DONE
W5	Field depth Field intelligence	Negotiability log: initial ask, revised quote, incentives, last closed comparable	▪ Discount-to-close observed on >=10 units	20 h	☐
W5	Rental layer Desk research	Rents by BHK and furnishing; deposit norms; tenant restrictions; vacancy proxies	▪ >=10 usable rental observations per locality	16 h	☐
W6	Decision model System & tooling	Pocket scorecard; risk matrix; compare view; EMI, yield and all-in-cost calculators	▪ Every score traceable to a source_ref	22 h	☐
W6	Certificate + go-live gate Compliance & admin	Certificate of Competency issued; MahaRERA number live; QR artwork for all ads	▪ COMPLIANCE GATE: marketing may now begin	10 h	☐
W7	Lead engine switch-on Demand generation	Buyer personas; referral map (alumni, CA, lender, corporate HR); pocket brief #1	▪ First 10 qualified leads; source tagged on every one	24 h	☐
W7	Deal workflow Deal execution	Client-fit questionnaire, shortlist template, visit script, negotiation and document checklists	▪ Playbook written before first live client	12 h	☐
W8	Distribution Demand generation	Weekly brief cadence; 2 co-broking agreements; 1 developer channel registration	▪ Inbound response rate measured, not assumed	22 h	☐
W8	First live clients Deal execution	Client matching run against real inventory; 5+ site visits accompanied	▪ Every lead has a next action and a date	16 h	☐

G3 · The 90-day checklist · continued

WK	GOAL	OUTPUT	GATE	HRS	DONE
W9	Negotiation cycle Deal execution	Offers, counters, seller and developer coordination, diligence with counsel	▪ First offers on the table	24 h	☐
W9	CRM discipline System & tooling	Every lead, unit, visit, objection and next action recorded in the workbook	▪ Zero deals tracked in WhatsApp only	10 h	☐
W10	Closure push Deal execution	Live negotiations driven to agreement; loan, legal and registration coordinated	▪ First closure or documented near-term pipeline	26 h	☐
W10	Referral loop Demand generation	Post-visit follow-up system; referral ask scripted into every interaction	▪ Referral coefficient measured	12 h	☐
W11	Evidence capture System & tooling	Closed prices, lost reasons, objections and counterparty response times captured	▪ Top 5 objections and top 5 data gaps visible	18 h	☐
W11	Gap remediation Desk research	The data gaps live deals exposed are filled — the only gaps that matter	▪ Gap list shrinks week over week	16 h	☐
W12	Half-yearly readiness Compliance & admin	Books, client files, source records and deal files in filing-ready state	▪ MahaRERA half-yearly report can be produced in one day	12 h	☐
W12	Decision gate System & tooling	90-day review against every gate; the go / hold / pivot memo written and dated	▪ Expand only on evidence — decision recorded and dated	22 h	☐

G4 · Glossary

Twenty-six terms used precisely throughout this document. Where a term has a loose market usage and a technical one, the technical one is intended.

Absorption

Units sold in a period. With QTS, the measure of whether a market is actually clearing.

Age of inventory

How long the current unsold stock has been unsold, in quarters. Mumbai: 13.5, improved from 14.3.

All-in cost

Agreement value plus stamp duty, registration, TDS, brokerage and GST. Roughly 8% above the headline in Mumbai.

Area basis

Carpet, built-up or saleable. The single most common source of misleading price comparisons in India.

Carpet area

Net usable floor area within walls, as defined under RERA. The only basis on which to advise.

Channel partner

Registered intermediary selling a developer's primary inventory, paid by the developer.

Co-broking

Two brokers splitting a transaction and its commission. Requires written terms in advance.

Discount-to-close

The gap between initial ask and registered price. Proprietary, and available nowhere publicly.

DPDP

Digital Personal Data Protection Act 2023 and its 2025 Rules. Applies to a one-person business.

Gross yield

Annual rent divided by capital value, before costs. Always shown separately from net.

IGR

Inspector General of Registration, Maharashtra. Source of registered instruments and Ready Reckoner rates.

Index-II

Registration extract summarising a registered instrument — parties, property, consideration, date.

MahaRERA

Maharashtra Real Estate Regulatory Authority. Registers projects and agents; issues the Certificate of Competency.

Metro cess

1% levy added to stamp duty in Mumbai, Navi Mumbai and Thane to fund metro rail.

MMR

Mumbai Metropolitan Region — the city plus Thane, Navi Mumbai, Kalyan, Vasai-Virar and Panvel.

Net yield

Gross yield after maintenance, vacancy, property tax and management. The only yield to show an investor.

Pocket (L4)

Sub-locality — the primary research unit in this system. Roughly 5–30 buildings.

QPR

Quarterly progress report filed by a promoter with MahaRERA. The check on advertised possession dates.

QTS

Quarters-to-sell: unsold inventory divided by quarterly absorption. Mumbai H1 2026: 6.5.

Qualified lead

Passes all four of budget, timeline, decision authority and area fit. Not a synonym for enquiry.

Ready Reckoner

Government-published minimum valuation, the floor for stamp duty. Frozen for FY2026-27.

Referral coefficient

New qualified referrals per closed client. Above 0.5, acquisition cost falls.

Sinking fund

Society reserve for major repairs. A large pending levy materially changes affordability.

Stale_after_days

Per-domain rule for when a fact must be re-verified before it may be shown to a client.

TDS 194-IA

1% deducted by the buyer on consideration of ₹50 lakh or more; Form 26QB within 30 days of month end.

TDS 194H

2% deducted from commission and brokerage above ₹20,000 in a financial year.

G5 · What to do on Monday morning

Sixty pages compress to eleven actions in the first week. Nothing here requires capital, permission or a decision you have not already made by reading this far.

DO THESE FIRST — THEY START CLOCKS YOU CANNOT COMPRESS

1. **Book the 20-hour Certificate of Competency programme** with NAREDCO, REMI or RAGC. Today. It is the longest-lead item in the venture and everything commercial waits on it [SRC-002].
2. **Start the MahaRERA agent registration application.** ₹10,000 for an individual [SRC-003].
3. **Engage a CA** and settle entity structure, GST position and the bookkeeping method before any money moves [SRC-031].

THEN, IN THE SAME WEEK

4. **Freeze the corridor in writing.** Six localities, 20–30 named pockets, dated and signed by yourself. The written freeze is what stops the scope creep that kills this plan.
5. **Create the schema.** geo_id, price_type, area_basis, sample_size, observed_date, source_ref, confidence, stale_after_days, conflict_flag. All mandatory from record one.
6. **Open the source registry** and add a row before you use any source, not after.
7. **Write the DPDP notice and consent text** before the first client conversation, not after the first fifty [SRC-023].

BEFORE THE END OF MONTH ONE

8. **Pull the MahaRERA extract** for every project in the pocket set. Promoter, RERA id, status, QPR, possession date. Flag anything unregistered explicitly [SRC-016].
9. **Run the first IGR e-Search sweep** and build the registered-price baseline. It is free, it covers Mumbai from 1985, and almost nobody competing with you does it systematically [SRC-015].
10. **Walk five pockets.** Not drive — walk. Note noise, access, waterlogging marks, walkability to transit and view obstruction. Write it up the same day.
11. **Do the capital conversation honestly.** ₹11.3 L, twelve months, drawings at ₹60,000. If that is not available, reduce the drawings or delay the start — do not start underfunded and hope.

Know a small geography better than the market, transact inside it, capture every observation and closure as structured evidence, and expand only when the economics repeat without you in every step.

Version 2.0 · researched to 14 August 2026 · 33 figures and 20 data files generated from a single evidence file, so no two artefacts in this pack can disagree with each other. Regenerate with `make all` when the underlying facts move — and they will.
